

# Exercises for the 8th SIPTA Summer School

July 24th - July 28th, 2018

## 1 Exercises

1. Consider the probability/credal set described by the constraints

$$p(\omega_1) \in [0.1, 0.3], p(\omega_2) \in [0.4, 0.7], p(\omega_3) = [0.1, 0.5]$$

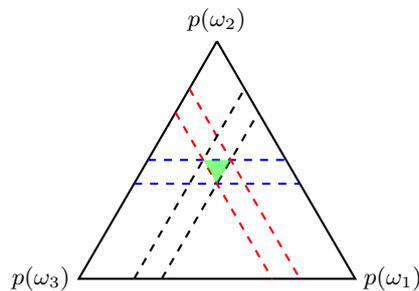

Show that these induce a belief function, e.g., by computing the lower probabilities and showing that the Möbius inverse is non-negative.

$\{\omega_1\}$	$\{\omega_2\}$	$\{\omega_3\}$	$\{\omega_1, \omega_2\}$	$\{\omega_1, \omega_3\}$	$\{\omega_2, \omega_3\}$	$\Omega$
$\underline{P}$						
$m$						

2. Consider the probability/credal set described by the constraints

$$p(\omega_1) \in [0.2, 0.3], p(\omega_2) \in [0.4, 0.5], p(\omega_3) = [0.2, 0.3]$$

Show that these do not induce a belief function, e.g., by computing the lower probabilities and showing that the Möbius inverse is negative for some set (hint: focus on big ones), or by showing that it is not 3-monotone.

$\{\omega_1\}$	$\{\omega_2\}$	$\{\omega_3\}$	$\{\omega_1, \omega_2\}$	$\{\omega_1, \omega_3\}$	$\{\omega_2, \omega_3\}$	$\Omega$
$\underline{P}$						
$m$						

3. Consider the space  $\Omega = \{a, b, c\}$  and the following mass functions:

$$\begin{aligned} m_1(\{b\}) &= 0.3, m_1(\{b, c\}) = 0.2, m_1(\{a, b, c\}) = 0.5 \\ m_2(\{a\}) &= 0.2, m_2(\{b\}) = 0.3, m_2(\{c\}) = 0.3, m_2(\{a, b, c\}) = 0.2 \\ m_3(\{a, b\}) &= 0.3, m_3(\{a, c\}) = 0.3, m_3(\{a\}) = 0.4 \end{aligned}$$

Build the partial order  $\sqsubseteq$  between  $m_1, m_2, m_3$ , reminding that

$$m_i \sqsubseteq m_j \text{ iff } \underline{P}_i(A) \geq \underline{P}_j(A) \text{ for all } A$$

4. The hotel provides the following plates for breakfast

$$a=\text{Century egg}, b=\text{Rice}, c=\text{Croissant}, d=\text{Raisin Muffin}$$

In a survey about their choices, respondents gave the reply

$$m(\{a, b\}) = \alpha, m(\{c, d\}) = 1 - \alpha$$

We learn that customer C does not like eggs nor raisins ( $C = \{b, c\}$ ), what can we tell about him choosing Rice by applying the focusing operation?

5. The hotel provides the following plates for breakfast

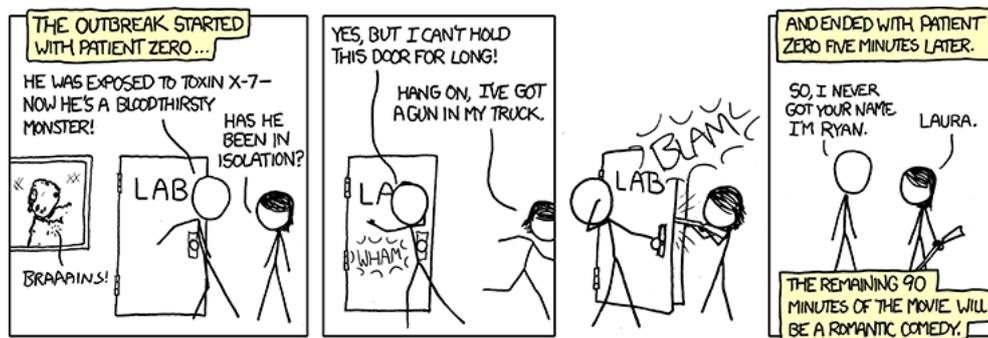

$$a=\text{Century egg}, b=\text{Rice}, c=\text{Croissant}, d=\text{Raisin Muffin}$$

In a survey about their choices, respondent gave the reply

$$m(\{a, b\}) = \alpha, m(\{c, d\}) = 1 - \alpha$$

We learn that suppliers no longer have eggs nor raisins ( $C = \{b, c\}$ ), what is the proportion of rice we should buy to satisfy customers by applying the revision operation?

6. A zombie apocalypse has happened, and you must recognize possible threats/supports

The possibilities  $\Omega$  are

- Zombie ( $Z$ )
- Friendly Human ( $F$ )
- Hostile Human ( $H$ )
- Neutral Human ( $N$ )

The sources  $S_i$  are

- Half-broken heat detector ( $S_1$ )
- Paranoid watch guy 1 ( $S_2$ )
- Half-broken Motion detector ( $S_3$ )
- Sleepy watch guy 2 ( $S_4$ )

Given this table of contour functions, a weighted average and a decision based on maximal plausibility

	$\hat{\omega}^1 = Z$				$\hat{\omega}^2 = H$				$\hat{\omega}^3 = F$			
	$Z$	$F$	$H$	$N$	$Z$	$F$	$H$	$N$	$Z$	$F$	$H$	$N$
$S_1$	1	0,5	0,5	0,5	1	0,5	0,5	0,5	0,5	1	1	1
$S_2$	1	0,2	0,8	0,2	0	0,3	1	0,3	0	0,4	1	0,4
$S_3$	1	0,5	0,5	0,5	0,5	0,7	0,8	0,7	1	0,5	0,5	0,5
$S_4$	1	1	1	1	0,2	0,2	1	0,5	0,2	1	0,4	0,8
$\mathbf{w}_1 = (0,5, 0,5, 0, 0)$												
$\mathbf{w}_2 = (0, 0, 0,5, 0,5)$												

Choose  $h_{\mathbf{w}_1}$  or  $h_{\mathbf{w}_2}$ ? Given the data, can we find a strictly better weight vector?
